

Even Better with EvenWall

Expand your Progressing Cavity Pump

- Increase pump run life
- Rated up to 225°C (440°F)
- Uniform elastomer swell and thermal expansion

Bringing Solutions to Surface

KUDU Progressing Cavity Pumps (PCP) typically have lower operating and capital costs compared to other artificial lift methods. KUDU PCP's are engineered to handle the most demanding environments with proven performance in light to heavy oil, thermal, dewatering and coal bed methane operations.

EvenWall technology increases the efficiency of PCP's by expanding the current capabilities of conventional pumps. The stator pressure is higher and more continuous, which allows

for reduced pump lengths, compared to a standard PCP. The elastomer's uniform wall thickness reduces heat build up and is rated up to 225°C (440°F).

The elastomer swells evenly enabling a consistent fit between the rotor and stator, improving pump run life. The reduction in swelling also makes EvenWall well suited for high API applications. KUDU's EvenWall PCP's require less drive power for the same production rate and depth.

KUDU's Complete PCP System

KUDU provides the perfect fit for any environment with the complete package including the PC Pump, KUDU Drivehead, Power Unit and the PCP Well Manager. KUDU also offers a high temperature package, perfect for SAGD and CSS applications. It features an all metal Progressing Cavity Pump capable of withstanding the extreme downhole conditions of thermal recovery. KUDU's customer focused approach encompasses exceptional design, superb service and technical training for customers.
